Ten live runs

Ten questions, ten different use cases, each asked of the agent with its live model on 11 and 12 October 2026, shown as the terminal prints it and checked against the bank's own pages.

Nothing was run again to make this document. Each run's saved `result.json` is rendered by the tool's own terminal view, so the figures, drivers, memo, confidence and caveats are what the run produced. Every amount is in Australian dollars: model costs are converted from the US-dollar bill at the RBA's rate for 9 October 2026 (A$1 = US$0.6979), and a memo's bare "$" is shown as A$. Each evaluation was worked out from the saved result and the filings it read, with no model call, and says what the answer got wrong as well as right.

#	Use case	Answered as	Movement	Citations	Gold	Cost
1	Net interest margin, from the bank's own written walk	`ANZ 1H26 nim`	1.56% to 1.53%	9/9	exact	A$0.34
2	Net interest margin, on the bank's headline basis	`WBC 1H26 nim`	1.92% to 1.89%	8/8	exact	A$0.37
3	CET1 ratio, from two half-year walks chained	`CBA FY26 cet1_ratio`	12.3% to 12.0%	5/5	exact	A$0.90
4	Cash earnings, through the earnings bridge	`NAB 1H26 headline_earnings`	A$3,583m to A$2,639m	32/32	exact	A$0.78
5	Credit impairment charge, collectively and individually assessed	`WBC 1H26 credit_impairment_charge`	A$250m to A$443m	10/10	exact	A$0.22
6	Return on equity, earnings against equity	`ANZ 1H26 roe`	10.2% to 10.6%	18/18	exact	A$0.52
7	A brand, answered as the bank that owns it	`BEN FY25 cost_to_income`	57.5% to 62.1%	10/10	n/a	A$0.20
8	A headline struck before tax	`JDO FY26 headline_earnings`	A$125.6m to A$168.1m	14/14	exact	A$0.65
9	A bank in no config file	`BBC FY26 nim`	1.52% to 1.96%	2/2	n/a	A$0.26
10	A period not held, found and read during the run	`CBA FY24 headline_earnings`	A$10,072m to A$9,836m	16/16	n/a	A$0.89

> 124 of 124 numeric citations on the page they cite. 7 of 7 headlines with dev gold exact in both periods, and 13 of 14 gold drivers right in sign and size. All ten reconcile within the tolerance their printed precision allows. 32 paid model calls, A$5.13 and 9 minutes 2 seconds in all. The notes against runs 2, 3, 4, 8 and 10 say what those answers got wrong: one caveat misstates what Westpac publishes, and the rest are slips in how the answer is laid out.

How each run was evaluated

- **Citations.** Every figure the answer cites from a table or the text is looked for on the page it cites, in the filing as stored (`citation_faithfulness` in the eval harness). A bar read off a chart has no text to find, so it's checked instead by the walk having to add up to the published endpoints.
- **Reconciliation.** The drivers have to add up to the movement, with anything left over reported against a tolerance taken from the printed precision.
- **Gold.** Where the 66 development cases cover the same question, the headline figures and the drivers are scored against the gold, read off the page each figure cites (`score_case`).
- **Behaviour.** What the question tests, whether the answer did it, and anything it got wrong.

RUN 1 OF 10

Net interest margin, from the bank's own written walk

```
$ bankresearch run --bank ANZ --period 1H26 --metric nim
```

ANZ writes its margin walk out in words on page 18 of its results document. A model reads each step with its value and the bank's sentence for it, and code keeps the reading only if every quote is on the page, every value is printed in its quote, and the steps add up to the published movement.

```
 OK  ANZ Group Holdings Limited
Net interest margin   1H26 against 1H25  (same period last financial year)
As of 2026-05-31
Basis: Net interest margin, cash basis
Both figures established and the drivers reconcile to the movement.
```

	1H25	1H26	Change	Figure confidence
Net interest margin	1.56%	1.53%	−3.0 bps	High 0.90

Drivers largest first

Driver	Contribution	Share	Confidence	Source
Markets activities	−5.0 bps	n/m	High 0.93	p.18
Assets pricing	−4.0 bps	n/m	High 0.93	p.18
Capital and replicating portfolio	+4.0 bps	n/m	High 0.93	p.18
Deposits pricing	−3.0 bps	n/m	High 0.92	p.18
Group Centre liquids	+3.0 bps	n/m	High 0.92	p.18
Assets and funding mix	+2.0 bps	n/m	High 0.91	p.18
Wholesale funding	0.0 bps	n/m	High 0.90	p.18

✓ Drivers explain **−3.0 bps** of **−3.0 bps** residual **0.0 bps** (tolerance 4.5 bps)
Explanation confidence **High 0.90** how much of the movement is attributed, and how well

Why, as the bank explains it

Assets pricing Continued competition across most divisions and the timing effect of RBA rate changes compressed asset pricing [p.18].
Deposits pricing Lower cash rates in New Zealand and international geographies, together with pricing competition, reduced deposit margins [p.18].
Wholesale funding Wholesale funding was broadly flat, with higher funding volume offset by a lower average spread [p.18].
Capital and replicating portfolio Higher volumes and higher average hedge rates on the capital and replicating portfolio lifted the margin [p.18].
Group Centre liquids A smaller average liquid asset balance held in the Group Centre division supported the margin [p.18].
Markets activities Markets' average interest earning assets grew faster than those of the rest of the Group, diluting the margin [p.18].
Assets and funding mix A favourable funding mix, mainly from stronger growth in at-call deposits and deposit growth outpacing lending growth, helped the margin [p.18].

What moved

ANZ's net interest margin (cash basis) fell 3.0 bps against 1H25, from 1.56% [p.10] to 1.53% [p.10]. Markets activities took 5.0 bps off the margin [p.18], mainly because Markets' average interest earning assets grew faster than the rest of the Group. Assets pricing took a further 4.0 bps off [p.18], which the bank attributes to continued competition across most divisions and the timing of RBA rate changes. Partly offsetting this, the capital and replicating portfolio added 4.0 bps [p.18] on higher volumes and higher average hedge rates. Deposits pricing took 3.0 bps off [p.18] on lower cash rates in New Zealand and international markets and pricing competition. Group Centre liquids added 3.0 bps [p.18] from a smaller average liquid asset balance, and assets and funding mix added 2.0 bps [p.18]. Wholesale funding had no effect [p.18].

Read before relying on this

1. The drivers are the issuer's own walk, written out on anz-1h26-results-document p.18: every step was found on the page and the steps reconcile to the published movement.
2. The accounting identity ran as a cross-check, and what it leaves unexplained is reported alongside.

Model calls, cost, time	4 calls (2 replayed from the cache), A$0.34, 26s
Run	20672a8f880a, 2026-10-12 03:58 UTC

- 1.56% to 1.53%, down 3bps, exact in both periods against the gold.
- Seven drivers from the bank's walk add up to the movement with nothing left over; each carries the bank's own cause.
- Two of the four model calls were answered by the response cache, for nothing.

RUN 2 OF 10

Net interest margin, on the bank's headline basis

```
$ bankresearch run --bank WBC --period 1H26 --metric nim
```

Westpac leads with its margin excluding notable items, and gives the lines of its identity on a different basis, so the identity can't split the headline without mixing bases. The bank's own walk on page 13 has to stand alone, and the answer has to say why.

```
 OK  Westpac Banking Corporation
Net interest margin   1H26 against 1H25  (same period last financial year)
As of 2026-05-31
Basis: Net interest margin, excluding notable items
Both figures established and the drivers reconcile to the movement.
```

	1H25	1H26	Change	Figure confidence
Net interest margin	1.92%	1.89%	−3.0 bps	High 0.92

Drivers largest first

Driver	Contribution	Share	Confidence	Source
Liquid assets	+5.0 bps	n/m	High 0.90	p.13
Capital and other	−3.0 bps	n/m	High 0.90	p.13
Loan interest spread	−2.0 bps	n/m	High 0.90	p.13
Deposit interest spread	−1.0 bps	n/m	High 0.90	p.13
Treasury and Markets contribution	−1.0 bps	n/m	High 0.90	p.13
Timing difference	−1.0 bps	n/m	High 0.90	p.13

✓ Drivers explain **−3.0 bps** of **−3.0 bps** residual **0.0 bps** (tolerance 4.0 bps)
Explanation confidence **High 0.90** how much of the movement is attributed, and how well

Why, as the bank explains it

Loan interest spread Tighter spreads in Australia due to competition more than offset higher spreads in New Zealand [p.13].
Deposit interest spread More customers qualified for the savings bonus rate and term deposit spreads narrowed, partly offset by favourable deposit mix and repricing of the consumer behavioural product's base rate [p.13].
Liquid assets Trading assets reduced, average liquid assets rose by less than average lending assets and spreads narrowed [p.13].
Capital and other A remediation provision in the current period and the non-repeat of items in the prior corresponding period [p.13].
Treasury and Markets contribution Lower Treasury income reduced the Treasury and Markets contribution [p.13].
Timing difference Timing differences of interest rate changes [p.13].

What moved

Westpac's net interest margin excluding notable items fell 3.0 bps against 1H25, from 1.92% [p.11] to 1.89% [p.11]. Liquid assets added 5.0 bps, as trading assets reduced, average liquid assets grew more slowly than average lending assets and spreads narrowed [p.13]. Capital and other took 3.0 bps off, reflecting a remediation provision in the current period and the non-repeat of items in the prior corresponding period [p.13]. Loan interest spread took 2.0 bps off, with tighter Australian spreads from competition more than offsetting higher spreads in New Zealand [p.13]. Deposit interest spread, the Treasury and Markets contribution and a timing difference each took 1.0 bps off [p.13]. The capital and other decline carries a remediation provision booked in the current period, so part of the margin fall rests on that item [p.13].

Read before relying on this

1. The drivers are the issuer's own walk, written out on wbc-1h26-results-document p.13: every step was found on the page and the steps reconcile to the published movement.
2. WBC publishes this measure only excluding notable items, so the measure and the figures it's explained by are all on that basis. The reported figures, including notable items, are recorded as alternative readings.
3. The 1H25 comparative is the restated figure (nii). The issuer's footnote states that comparatives have been restated without identifying which, so every comparative read from that table is flagged.
4. Path B was not run: WBC publishes nim and the lines of its identity on different bases, so the identity would reconcile to neither. The issuer's own walk stands alone.

```

Evaluation

Status	OK
Numeric citations on the page cited	8/8
Against the dev gold	headline exact
Model calls, cost, time	4 calls (2 replayed from the cache), A$0.37, 32s
Run	220b1fa59aba, 2026-10-12 01:30 UTC

- 1.92% to 1.89%, down 3bps, exact in both periods against the gold.
- Six drivers from the walk reconcile exactly, and the identity is declined with the reason rather than run across bases.
- A mistake in the answer: its second caveat says Westpac publishes the margin only excluding notable items. It doesn't. Page 50 of the same document gives the reported margin, up 1bp from 1.88% to 1.89%. The run recorded the 1.88% as another basis but didn't show it, and the answer should have given the reported movement beside the headline.
- Its third caveat flags a restated comparative for net interest income, which this answer doesn't use.

RUN 3 OF 10

CET1 ratio, from two half-year walks chained

```
$ bankresearch run --bank CBA --period FY26 --metric cet1_ratio
```

CBA walks its capital ratio half by half, so no page explains the year. The run reads the first half off a chart in its 1H26 results document (page 48) and the second off a chart in its FY26 presentation (page 32), checks each against the published ratio at its two ends, and joins them at the balance between.

OK **Commonwealth Bank of Australia**

CET1 ratio **FY26** against **FY25** (same period last financial year)
As of 2026-08-31
Both figures established and the drivers reconcile to the movement.

	FY25	FY26	Change	Figure confidence
CET1 ratio	12.3%	**12.0%**	**-30.0 bps**	**High 0.94**

Drivers largest first

Driver	Contribution	Share	Confidence	Source
Cash NPAT	+213.0 bps	n/m	**Medium 0.85**	p.32, p.48
Dividends net of DRP issuance	−163.0 bps	n/m	**Medium 0.85**	p.32, p.48
RWA (Risk-weighted assets)	−79.0 bps	n/m	**Medium 0.85**	p.32, p.48
Other disclosed movements	+1.0 bps	n/m	**Medium 0.81**	p.32, p.48

✓ Drivers explain **−28.0 bps** of **−30.0 bps** residual **−2.0 bps** (tolerance 14.0 bps)
Explanation confidence **Medium 0.85** how much of the movement is attributed, and how well

Why, as the bank explains it

RWA (Risk-weighted assets) For the credit risk-weighted asset part, the bank says 72bpts of capital went into credit RWA over the year on strong volume growth, especially in commercial portfolios and domestic residential mortgages [p.9].

What moved

Commonwealth Bank's CET1 ratio fell 30.0 bps, from 12.3% [cba-fy25-results-document p.120, p.106, cba-fy26-results-document p.120] to 12.0% [p.106, cba-fy26-results-document p.120]. Cash NPAT added 213.0 bps to the ratio [p.48, p.32]. Dividends net of DRP issuance took 163.0 bps off [p.48, p.32]. Higher risk-weighted assets took a further 79.0 bps off [p.48, p.32]. Within that, the bank says it deployed 72bpts of capital into credit risk-weighted assets over the year, on strong volume growth, particularly in commercial portfolios and domestic residential mortgages [p.9]. Other disclosed movements added 1.0 bps [p.48, p.32].

Read before relying on this

1. The drivers are the issuer's own walks for the two halves, chained: FY25 to 1H26 as written on cba-1h26-results-document p.48, and on to FY26 as written on cba-fy26-investor-presentation p.32. Each was found on its page and reconciled to the published balances at its own two ends.
2. The walk's "Cash NPAT" bar was matched to capital generated by earnings by the model, not by the issuer's wording.
3. The walk's "RWA" bar was matched to risk-weighted assets by the model, not by the issuer's wording.
4. No walk spanned FY25 to FY26; two half-on-half walks were chained, and each driver cites the half or halves it appears in.
5. The accounting identity ran as a cross-check, and what it leaves unexplained is reported alongside.

Against the dev gold	headline exact; 0 of 1 gold drivers right
Model calls, cost, time	8 calls, A$0.90, 99s
Run	9d2cd916a337, 2026-10-12 04:04 UTC

- 12.3% to 12.0%, down 30bps, exact against the gold. Earnings added 213bps, dividends took 163, risk-weighted assets 79, other movements added 1.
- 2bps left over against a 14bp tolerance, because CBA prints its ratio to one decimal place.
- The one driver the dev gold covers, risk-weighted assets, is -79bps on the bank's own walks against -62.7bps in the gold, which splits the ratio by its identity instead. Both are right under their own method; the case has no gold for the bank's walks yet.
- Medium confidence: reading a chart and joining two walks each take something off.
- Two slips in the wording: the first caveat says both walks were "written" on those pages, though both were read off charts after the text readings failed their checks, and the memo's first citation puts p.106, a page of the FY26 presentation, straight after another document's name.

✓ Drivers explain **-A$944m** of **-A$944m** residual **A$0m** (tolerance A$4m)
Explanation confidence **High 0.92** how much of the movement is attributed, and how well

```
 Why, as the bank explains it
Net interest income  The bank says net interest income includes an A$169m increase from
movements in economic hedges, offset in other operating income, and an A$67m decrease from
exchange rate movements on translation of its New Zealand operations [p.21].
Fees, markets, wealth and other operating income  The bank says the decrease includes A$169m
from movements in economic hedges, which is offset in net interest income [p.21].
```

```
 What moved
NAB's cash earnings fell A$944m (26.3%), from A$3,583m to A$2,639m [p.11, p.21]. Operating
expenses were the largest driver, taking A$1,560m off earnings [p.11]; the bank says the rise
was partly offset by productivity benefits, lower payroll remediation and lower AUSTRAC
enforceable undertaking costs [p.21]. Net interest income added A$718m [p.11, p.26], of which
A$552m came from margin and A$176m from volume [p.22]. The credit impairment charge took A$358m
off earnings [p.11], mainly from a higher collective charge that includes A$300 million of
forward-looking provisions for potential stress from the Middle East conflict [p.21]. Do not
read the fall as an underlying decline: the bank says that excluding large notable items and New
Zealand translation effects, cash earnings rose A$27 million or 0.8% [p.21].
```

```
 Read before relying on this
1. Left out of the narrative, because its evidence only partly supports it: "Operating expenses
took A$1,560m off earnings [ev_020, ev_055]; the bank attributes the increase mainly to salary
inflation and continued investment in lenders, bankers and technology [ev_082], partly offset by
productivity gains and lower remediation and AUSTRAC EU costs [ev_081]." (The −A$1,560m figure
matches the computed driver and ev_081 gives the offsets, but that increase is dominated by
A$1,347m of large notable items (p.11); ev_082's 'primarily driven by salary expense
inflation...' is from p.29 without context and appears to describe the ex-notable increase, so
attributing the whole A$1,560m mainly to salary inflation and investment is not supported as
written.)
2. Net interest income reconstructed from margin and balances differs from the reported figure
by 17.4m; the volume, margin and day-count split is indicative.

 write-backs and recoveries

 ✓ Drivers explain +A$193m of +A$193m   residual A$0m  (tolerance A$3m)
Explanation confidence  Medium 0.75   how much of the movement is attributed, and how well
 Why, as the bank explains it
 Collectively assessed charge  The bank attributes the higher impairment charge mainly to a
 larger collectively assessed provision charge [p.21].

 What moved
 Westpac's credit impairment charge rose A$193m, from A$250m in 1H25 to A$443m in 1H26 [p.119,
 p.9]. The collective charge was almost the whole of the move, adding A$185m as it went from
 A$203m to A$388m [p.21]; the bank says the higher charge was "mainly due to a higher CAP charge"
 [p.21]. The individually assessed charge, net of recoveries, added A$8m: the gross individual
 charge was A$173m against A$162m a year earlier, with recoveries of A$118m against A$115m
 [p.21]. The bank gives no cause for the individual movement. As a share of average loans, the
 charge was 10 basis points, up from 6 basis points [p.21]. The collective charge is reported in
 aggregate, so the reader cannot tell from these figures how much came from volumes, credit
 quality, outlook or overlays.

 Read before relying on this
 1. The 1H25 comparative is the restated figure (impairment_collective and 2 other component(s)).
 The issuer's footnote states that comparatives have been restated without identifying which, so
 every comparative read from that table is flagged.
 2. Recoveries are printed on their own line and counted with the individually assessed charge,
 which is defined net of them.
 3. Collective charge not split into volume, quality, outlook and overlays; reported in
 aggregate.

↳ Income tax, including effective rate changes	−21.8 bps	n/m	**High 0.92**	p.10
Change in average equity (buybacks, retained earnings, other)	−11.7 bps	n/m	**High 0.92**	p.10, p.11, p.23

✓ Drivers explain **+48.2 bps** of **+40.0 bps** residual **−8.2 bps** (tolerance 11.0 bps)
Explanation confidence **Medium 0.82** how much of the movement is attributed, and how well

Why, as the bank explains it

Fees, markets, wealth and other operating income Other operating income rose, including higher net fee and commission income [p.21] and higher markets income, where a rise in markets net interest income outweighed a small fall in markets other operating income [p.21].
Operating expenses (higher costs = negative) Restructuring expenses fell on fewer operational changes across the Group [p.24]; personnel costs fell on productivity initiatives [p.24]; technology costs fell on lower asset impairments, lower amortisation and simplification, partly offset by vendor inflation [p.24]; premises costs fell on lower depreciation [p.24].
Credit impairment charge (higher charge = negative) For part of the charge, the bank cites a weaker credit risk profile in Institutional and Business & Private Bank, portfolio growth and a net increase in management temporary adjustments for uncertainty and economic volatility [p.27].
Income tax, including effective rate changes The effective tax rate edged down from 29.7% to 29.6% [p.31], helped by lower non-deductible interest on convertible instruments and higher equity accounted earnings [p.31], partly offset by prior-period adjustments, withholding tax and non-deductible ASIC penalties [p.31].

What moved

Return on equity (cash basis) rose 40.0 bps, from 10.2% [p.10] to 10.6% [p.10]. Higher earnings added 60.0 bps [p.23, p.11]. Within earnings, lower operating expenses added 58.8 bps [p.10], with restructuring expenses down A$85m [p.24], personnel expenses down A$43m [p.24] and technology expenses down A$35m [p.24]. Higher other income added 53.7 bps [p.10]; other operating income rose A$190m [p.21], including net fee and commission income up A$56m [p.21] and markets income up A$35m [p.21]. A larger credit impairment charge took 36.5 bps off [p.10], which the bank partly attributes to a weaker credit risk profile in Institutional and Business & Private Bank, portfolio growth and higher management overlays [p.27]. Higher tax took 21.8 bps off [p.10], though the effective tax rate fell from 29.7% to 29.6% [p.31]. Higher average equity took 11.7 bps off [p.11].

↳ Other operating income	+61.9 bps	▇	n/a	High 0.92	p.35

✓ Drivers explain **+467.3 bps** of **+460.0 bps** residual **−7.3 bps** (tolerance 11.0 bps)
Explanation confidence **High 0.92** how much of the movement is attributed, and how well

```
 Why, as the bank explains it
Effect of the change in operating expenses  The bank says expenses rose because of inflationary
pressures, higher software and amortisation charges and an increase in investment spend [p.103].
```

```
 What moved
Bendigo and Adelaide Bank's cost-to-income ratio rose 460.0 bps, from 57.5% in FY24 to 62.1% in
FY25 [p.35, p.103]. Higher expenses did almost all of it, adding 444.0 bps to the ratio as
operating expenses rose from A$1,122.8m to A$1,209.4m [p.35]. The bank attributes the higher
expenses to inflationary pressures, higher software and amortisation charges and increased
investment spend [p.103]. Lower income added a further 23.3 bps, with operating income slipping
from A$1,954.2m to A$1,946.6m [p.35]. Within income, other income fell from A$288.0m to
A$267.8m, adding 61.9 bps to the ratio [p.35], while net interest income rose from A$1,666.2m to
A$1,678.8m, taking 38.6 bps off it [p.35].
```

```
 Read before relying on this
1. Up is a brand of Bendigo and Adelaide Bank Limited, which reports it within its own results,
so these are Bendigo and Adelaide Bank Limited's figures.
2. No breakdown of expenses by category was read, so the expense effect is one figure, not split
by category.
```

↳ Change in average interest-earning assets at prior margin	+A$62.5m	▓▓▓▓▓▓▓▓	n/m	**High 0.92**	p.34, p.35
Credit impairment charge (higher charge = negative)	−A$42.2m	▓▓▓▓▓	n/m	**High 0.92**	p.33
Operating expenses (higher costs = negative)	−A$14.8m	▓▓	n/m	**High 0.92**	p.33
Fees, markets, wealth and other operating income	+A$6.2m	▓	n/m	**High 0.92**	p.33

✓ Drivers explain **+A$42.5m** of **+A$42.5m** residual **A$0m** (tolerance A$0.3m)
Explanation confidence **High 0.92** how much of the movement is attributed, and how well

Why, as the bank explains it

Operating expenses (higher costs = negative) For the non-employee part only, up 4%, the bank cites higher deposit marketing expenses, inflationary increases in supplier contracts and growth-related activity [p.32].

Credit impairment charge (higher charge = negative) The bank says the higher charge reflected higher individually assessed provisions and a larger collective provision, driven by changed forward-looking macroeconomic assumptions and an overlay for sectors under pressure from the uncertain environment [p.32].

Change in average interest-earning assets at prior margin The bank says lending growth reflected the strength of its differentiated customer value proposition, continued recruitment of skilled bankers and improving productivity [p.32].

What moved

Profit before tax rose A$42.5m (33.8%), from A$125.6m [p.33] to A$168.1m [p.33]. Net interest income was the largest driver, adding A$93.3m [p.33]: volume added A$62.5m and margin A$29.9m [p.34, p.35], with NIM at 3.13%, up 20bps from 2.93% [p.35]. The bank attributes lending growth to its differentiated customer proposition, continued banker recruitment and improving productivity [p.32]. Credit impairment took A$42.2m off, rising from A$75.5m to A$117.7m [p.33], on higher individually assessed provisions and a larger collective provision driven by revised macroeconomic assumptions and a sector overlay [p.32]. Operating expenses took A$14.8m off [p.33], with non-employee expenses up 4% on deposit marketing, supplier cost inflation and growth-related activity [p.32]. Other income added A$6.2m [p.33].

Read before relying on this

1. Judo has led with profit before tax since its 2026 half year, so both periods are compared before tax and the bridge stops there. Its profit after tax, which return on equity rests on, is reported beside it.

✓ Drivers explain **+44.0 bps** of **+44.0 bps** residual **0.0 bps** (tolerance 2.5 bps)
Explanation confidence **High 0.87** how much of the movement is attributed, and how well

```
 Why, as the bank explains it
Lending  The bank's walk assigns this component to lending [p.19], and it attributes the margin
improvement to a portfolio mix that continued to favour higher-return assets [p.5].
```

```
 What moved
BNK's net interest margin (average) rose 44.0 bps, from 1.52% in FY25 [p.18] to 1.96% in FY26
[p.18]. Lending was the largest contributor, adding 23.0 bps [p.19]. Deposits and funding added
18.0 bps [p.19]. Capital and liquidity added 3.0 bps [p.19]. The bank attributes the improved
margin to a portfolio mix that "continued to favour higher-return assets" [p.5]. The higher
margin supported net interest income, which the bank reports increased by 9.9% [p.5], to
A$24.042m [p.16] from A$21.882m [p.16]. The walk leaves nothing unexplained, and no notable item
or change of basis affects the margin.
```

```
 Read before relying on this
1. The drivers are the issuer's own walk, read from the chart on bbc-fy26-investor-presentation
p.19 and reconciled to the published movement before use.
```

✓ Drivers explain **−A$236m** of **−A$236m** residual **A$0m** (tolerance A$4m)
Explanation confidence **High 0.92** how much of the movement is attributed, and how well

```
 Why, as the bank explains it
```

Net interest income An 8 basis point fall in net interest margin to 1.99%, partly offset by a A$33 billion rise in average interest earning assets [p.28, p.26].

Fees, markets, wealth and other operating income Higher volume-driven commissions and lending fee income and higher Markets trading and sales income, partly offset by lower merchants revenue from higher scheme costs and reduced equities income [p.26].

Operating expenses (higher costs = negative) Higher staff costs from inflation and additional technology spend to support strategic priorities, partly offset by productivity initiatives [p.26]; staff expenses specifically rose on wage inflation [p.31].

Credit impairment charge (higher charge = negative) Lower collective provisions, reflecting rising house prices, slowing interest rate rises and an improved outlook for Consumer Finance [p.26].

Income tax, including effective rate changes A higher effective tax rate from non-deductible hybrid capital distributions, repeal of the offshore banking unit concession and a prior-year one-off from finalising earlier tax matters [p.35].

```
 What moved
```

Cash NPAT fell A$236m, or 2%, from A$10,072m to A$9,836m [p.141, p.26]. Operating expenses took A$360m off earnings [p.16]; the bank attributes the rise to higher staff costs from inflation and additional technology spend, partly offset by productivity initiatives [p.26]. Lower credit impairment added A$306m [p.16, p.34], primarily from lower collective provisions reflecting rising house prices, slowing rate rises and a better Consumer Finance outlook [p.26]. Other income added A$271m [p.16, p.30], mainly on volume-driven commissions, lending fees and Markets trading income [p.26]. Net interest income took A$232m off [p.16, p.28], as margin fell 8 bps to 1.99% while average interest earning assets rose A$33 billion or 3% [p.28]; within this, margin took A$902m off and volume added A$672m [p.18]. Tax took a further A$221m off [p.16, p.35], with the effective tax rate rising from 28.9% to 30.5% [p.35].

```
 Read before relying on this
1. Commonwealth Bank of Australia FY24 wasn't in the saved data. Its results document was found
on the bank's own site or the ASX, checked and read for this run: found "2024 Full Year Results
Profit Announcement", released 2024-08-14, in the ASX's list of CBA's announcements; found and
ingested cba-fy24-results-document from
https://announcements.asx.com.au/asxpdf/20240814/pdf/066l9g0l41686l.pdf: 44 figure(s) stored, 0
quarantined, 12/12 identity checks passed
2. Left out of the narrative, because its evidence only partly supports it: "Cash NPAT fell
A$236m (2.3%), from A$10,072m to A$9,836m [ev_030][ev_008][ev_045]." (A$236m fall and both
endpoints are evidenced, but the 2.3% figure is not printed anywhere (page and ev_045 say 2%)
```

nor in the computed list.)
3. The FY23 comparative is the restated figure (headline_earnings and 7 other component(s)). The issuer's footnote states that comparatives have been restated without identifying which, so every comparative read from that table is flagged.
4. Net interest income rebuilt from margin and balances is A$51.3m below the reported figure, so its split into volume, margin and day count is indicative.

Evaluation

Status	OK
Numeric citations on the page cited	16/16
Against the dev gold	no dev case covers this question
Model calls, cost, time	5 calls, A$0.89, 93s
Run	cf0d7aaee682, 2026-10-11 21:31 UTC

- Cash NPAT A$10,072m to A$9,836m, down A$236m; five lines of the bridge add up to the movement exactly.
- The checker struck the memo's opening sentence for giving the fall as 2.3% where the page says 2%; the memo shown opens with 2%.
- The restated FY23 comparative is flagged. No dev case covers FY24, so there is no gold; every figure is on the page it cites.
- The margin and volume lines under net interest income add to -A$230m against -A$232m; the fourth caveat calls the split indicative.
- The quotes under What was read carry numbers from a neighbouring column, such as "Operating expenses (12,337) 2". The figures read are the right ones, and all 12 identity checks passed.

Reading these runs

Runs 1 and 3 were made after confidence was reworked to come from what stands behind each figure and driver (DESIGN.md ADR-069 and ADR-072), and their drivers score by how each was read and how large it is against its rounding. The other eight were scored with the first rubric, which gave every clean figure the same score, so several of them show 0.92.

Runs 1 and 3 also carry a caveat saying that what the identity's cross-check leaves unexplained is "reported alongside". The caveat now states the figure.

Some caveats show internal names where they should use the bank's words: "(nii)" in run 2, "(impairment_collective and 2 other component(s))" in run 5, "(headline_earnings and 7 other component(s))" in run 10, and evidence ids such as "ev_020" in the sentences runs 4 and 10 left out of their memos. The footers of runs 2 and 9 count only the calls that were paid for; the evaluation beside each gives both.

Runs 1 and 3 came from a batch of five live runs on 12 October that also probed two edge cases, a filing not held and a result not yet released. That batch found ten anomalies, all fixed since and held by tests, and is recorded in `evals/results/20261012T041020Z`. The full development and held-out results are in `evals/results/` and the README.
